## Project Description

### Background

The main goal of this project is to develop, pilot and document a practical approach to making teaching and educational materials more FAIR (findable, accessible, interoperable, reusable), open and reproducible.

Science should be open, reproducible and verifiable. Yet, investigations across many scientific disciplines have uncovered that this might not be the case for a large proportion of published findings in the scientific literature. For example, several studies in the research field of Psychology estimate that more than half of research is not reproducible (Collaboration, 2015; Crüwell et al., 2023; Hardwicke

et al., 2021; Obels et al., 2020; Wicherts et al., 2006). Thus, in an online survey among 1,500 researchers, 90% of the respondents agreed that science faces a “reproducibility crisis” (Baker, 2016). One key driver of this issue of irreproducibility is that materials needed to reproduce the results of a given study (research data, analysis code, software or other materials), are often not accessible, not even “upon (reasonable) request”. Even if resources are shared, they are often incomplete and do not allow for independent verification or reuse. Together, many researchers agree that “[...] accumulated evidence indicates that there is substantial room for improvement with regard to research practices to maximize the efficiency of the research community’s use of the public’s financial investment.” (Munafò et al., 2017)

While issues of accessibility and re-usability of research outputs are frequently discussed in the context of research data and analysis code, it is important to note that the same issues also apply to other outputs of academic activity, in particular the preparation and dissemination of teaching materials and other educational resources. Teaching activities take up a sizable portion of the working time of researchers. In Germany, lecturers at publicly-funded universities are required (by legal ordinances) to fulfill a certain number of teaching hours. Thus, a lot of time and expertise is put into the development of teaching materials. However, these valuable learning resources are rarely publicly available for public education or as a starting point for further (potentially collaborative) development by other educators.

To address the urgent need to improve infrastructure and academic frameworks supporting the reuse of scholarly data, a diverse consortium of stakeholders in science developed the FAIR Data Principles (Wilkinson et al., 2016). The FAIR principles state that research outputs should be Findable, Accessible, Interoperable and Reusable (Wilkinson et al., 2016). Originally developed as guiding principles for scientific data management and stewardship (Wilkinson et al., 2016), the FAIR principles are equally applicable to other types of scientific outputs, including teaching materials (see, e.g., Garcia et al., 2020). While some general recommendations exist on how to make teaching materials FAIR and reproducible (see, e.g., Garcia et al., 2020), specific guidelines, practical examples or tools for concrete implementation are scarce. The goal of this project is to develop a concrete approach to implement the development of FAIR and reproducible teaching materials, pilot this approach in a concrete learning setting at University of Hamburg, as well as evaluate and document the experiences as guidelines for other researchers.

## Implementation Plan

### Overview of implementation plan

1. Create a framework (in the form of a manual) for developing open educational resources (OER) in line with FAIR principles using [Quarto](#) and [Git](#)
2. Implement the framework in a concrete course (for example, in a seminar) in winter semester 2025/25
3. Offer training to teachers at University of Hamburg to implement the framework in their own teaching
4. Evaluate the impact of the teaching framework using surveys and interviews with teachers and students

53 In the proposed project, we will develop a framework for creating open educational resources (OER)  
54 in a transparent, reproducible fashion, in line with FAIR principles (Wilkinson et al., 2016) using the  
55 open-source software tools [Quarto](#) and [Git](#). First, we will develop the framework in the form of a  
56 manual with concrete recommendations and templates to implement FAIR and reproducible teaching  
57 using Quarto and Git [for preparatory work, see e.g., Plomp & Wittkuhn (2023)]. Next, we will  
58 implement this framework in a concrete teaching project (for example, a seminar) at University of  
59 Hamburg during the winter semester 2024/25. In addition, we will offer teaching research staff at the  
60 home institution (Institute of Psychology at University of Hamburg) opportunities to learn about both  
61 Quarto and Git, with a specific focus on creating open educational resources themselves (for example,  
62 websites, presentations and online surveys). This will allow lecturers to implement FAIR principles  
63 and reproducibility in their own teaching. Finally, we will document and evaluate the approach, also  
64 collecting feedback from both students and teachers via online survey and structured interviews. This  
65 documentation will result in a set of concrete recommendations in the implementation of FAIR and  
66 reproducible teaching materials for reuse by other teachers, lecturers and research institutions.

67 Our approach will rely on two technical tools: [Quarto](#) and [Git](#) that we will briefly introduce in the  
68 following section.

69 [Quarto](#) is a free and open-source scientific and technical publishing system developed by the open  
70 source data science company [Posit](#) (formerly know as RStudio). Quarto allows to create and publish  
71 reproducible, production quality articles, presentations, dashboards, websites, blogs, and books in  
72 various formats like HTML, PDF, MS Word and ePub. Authors can use Jupyter notebooks or write  
73 plain text Markdown in their favorite editor. As a literate programming tool, Quarto can integrate  
74 prose with widely used programming languages like Python, R, Julia, and Observable. In the context  
75 of teaching materials, Quarto may be used to generate course websites, online textbooks and presen-  
76 tations, all within one technical framework. Providing educational materials that are accessible to  
77 diverse groups of learners is an important but often overlooked aspect in the preparation of teaching  
78 materials. Quarto offers many tools that support accessibility and therefore allow for equitable and  
79 inclusive access to educational resources. For example, images and icons on Quarto websites can in-  
80 clude metadata that make these elements accessible to screen readers. Figures created with code can  
81 include alternative text and there is code syntax highlighting with accessible color contrast. Finally,  
82 presentations can play sounds when slides are advanced which makes them more accessible for blind  
83 users. Quarto is free to use, open source and available for all major operating systems (Windows,  
84 macOS and Linux).

85 [Git](#) is a free and open-source distributed version control system that tracks changes in any set of com-  
86 puter files, usually used for coordinating work among programmers who are collaboratively developing  
87 source code during software development. Due to its extensive benefits for transparent distributed  
88 work on digital objects, Git is increasingly adopted by scientists for research project management and  
89 collaborative development of text, code and data. Git is arguably the most popular version control  
90 system and can be considered a standard tool in the software industry and its popularity is evidenced  
91 by the 100 million of the popular repository hosting service GitHub <sup>1</sup>. “Version control is an approach  
92 to record changes made in a file or set of files over time so that you and your collaborators can track  
93 their history, review any changes, and revert or go back to earlier versions” (The Turing Way Com-  
94 munity, 2022). Version control allows to keep track of changes in a directory on a computer (called a

---

<sup>1</sup>(Source: [Wikipedia](#))

95 “repository”). Users can take snapshots (called “commits”) of the repository at any time. This allows  
96 to know the history of changes and understand what was changed when and by whom. Further, users  
97 can compare commits and go back to any previous state of their repository. In addition, Git allows  
98 to work on parallel versions (called “branches”) and flexibly integrate (or “merge”) them. Repository  
99 hosting services like GitHub, GitLab, BitBucket or Codeberg extend the benefits of version control by  
100 aspects of collaboration. Repositories can be uploaded (or “pushed”) to an online repository hosting  
101 service (called a “remote”) and shared with others. Repositories can be shared privately with a group  
102 of trusted collaborators but also made publicly available to anyone. This allows to work on the same  
103 files at the same time. Others can read, copy, edit and suggest changes. By making the repository  
104 public, work can be shared openly and transparently. Git is free to use and [open-source](#). It is a  
105 command-line tool and available for all major operating systems (Windows, macOS and Linux). In  
106 addition, several graphical user interfaces exist and Git is integrated into many integrated development  
107 environments (IDEs) like RStudio and Visual Studio Code.

## 108 **Description of the situation and equipment of the university**

109 Teaching is a central pillar of any university and in particular at the University of Hamburg with its  
110 motto: “Der Forschung, Der Lehre, Der Bildung” (“To research, to teach, to educate and form”). In  
111 winter semester 2022/2023, more than 40,000 students (including doctoral students and students on  
112 academic leave) were enrolled at University of Hamburg in 75 bachelor’s programs and 89 master’s  
113 programs (for details, see [facts and figures on the university homepage](#)). It becomes evident that this  
114 involves a lot of teaching and therefore time that is spent to create learning resources. The University  
115 of Hamburg provides platforms that support the development and distribution of teaching materials  
116 within the university.

117 Since 2009, the University of Hamburg uses [OpenOlat](#), a teaching and learning platform for compre-  
118 hensive eLearning courses. OpenOlat is the teaching and learning platform for comprehensive digital  
119 teaching offerings. OpenOlat supports university teacher in daily tasks and workflows with tools for  
120 information provision, event organization and communication. It is particularly suitable for supple-  
121 menting courses with a wide range of learning and exercise materials and for using digital examination  
122 formats.

123 To examine, the effectiveness of OpenOlat for the implemenatarion of FAIR principles and repro-  
124 ducibilty, we considered all entries assigned to the Institute of Psychology at the Department for  
125 Psychology and Human Movement Science. At the time of writing this proposal, for this institution  
126 OpenOlat listed 21 entries in total (see Figure 1). Of these 21 entries, 8 entries (ca. 40%) included  
127 relevant metadata, like the semester when the course took place. Strikingly, only 2 of 21 (ca. 10%)  
128 of the learning resources were available without access limitations (for example, password protection  
129 with an access code). While it is possible that different users get access to different resources (for  
130 example, students might have access to more learning resources than staff), it is probably fair to say  
131 to say that only a minority of learning resources are readily available for reuse and extension. In this  
132 example, those materials that are available are typically slides in PDF format. While the accessibility  
133 of learning resources is always better than no accessibility, opportunities for easy reuse and extensions  
134 are limited with PDF format. Together, this example illustrates the broader point made in the project

background that learning resources are not readily available and if they are available, come in formats that are limited with respect to reuse and extension.

Figure 1: Screenshot of the OpenOlat portal when filtering for educational resources assigned to the Institute of Psychology

Another infrastructure offered by University of Hamburg is a search portal for teaching called “Lehre-Navi” (<https://www.uni-hamburg.de/lehre-navi.html>). The “Lehre-Navi” portal was designed by the DUTy (Digital University Teaching Literacy) team in the “Digital and Data University Teaching Literacy” (DDLitLab) project at University of Hamburg, but is largely based on the material and services already provided elsewhere at the university. These offerings - as well as general information for teachers - are brought together on the Lehre-Navi platform. Again, while the Lehre-Navi platform offers a great diversity of open learning resources, from technical instructions and text to audio and video recordings, these materials do not offer mechanisms to effectively reuse and extend the materials.

Importantly, both these infrastructures (OpenOlat and Lehre-Navi) do not offer a systematic way to support collaborative development of learning resources. While OpenOlat allows to synchronize collaborative work in office tools using OnlyOffice, this limits teaching formats to office formats similar to Word, Powerpoint and Excel, which are widely used but proprietary programs. A core advantage of the proposed approach is that it’s at the same time fully independent from institutional infrastructure and can therefore be easily transferred between institutions but can also integrate with infrastructure that universities already provide. As briefly described in the [project description](#), the tools proposed for our approach to the development of teaching materials, Quarto and Git, are free to use, open source and

153 available for all major operating systems (Windows, macOS, Linux). They are easy to install and there  
154 is extensive documentation on their use online. In addition, the applicant is experienced in teaching  
155 these tools (for Git, see for example: <https://lennartwittkuhn.com/version-control-course-uhh-ss24/>;  
156 for Quarto, see for example: <https://lennartwittkuhn.com/quarto-workshop/>). To share contents  
157 tracked with Git with others, a Git repository hosting service like [GitHub](#) or [GitLab](#) is needed. While  
158 platforms like [GitHub](#) offer more than enough functionality for the free development of content on  
159 their platform, it is relevant to consider that these services are offered by for-profit companies (here,  
160 Microsoft) that could change access to resources or their pricing policy in way that disadvantages  
161 researchers. Here, the University of Hamburg offers an instance of the Git repository hosting platform  
162 GitLab (see [https://gitlab.rrz.uni-hamburg.de/users/sign\\_in](https://gitlab.rrz.uni-hamburg.de/users/sign_in)). For details in German see here: <https://www.rrz.uni-hamburg.de/services/datenhaltung/repositories/gitlab.html> Together, the tools at the  
163 center of our proposed approach are readily available to researcher and can be easily integrated with  
164 existing infrastructure provided by the University of Hamburg.  
165

## 166 **Target group**

167 There are two main target groups of the proposed project: research staff and students.

168 The first main target group of the project are research staff at the Institute of Psychology at the  
169 University of Hamburg who are involved in teaching. Our project aims to develop and pilot a new  
170 approach to the development of teaching materials. As described in the [implementation plan](#), we plan  
171 to involve research staff in the following way: First, we will offer workshops on how to create FAIR and  
172 reproducible teaching materials using Quarto and Git. Second, we will support teaching research staff  
173 in the implementation of the proposed approach in their teaching. Third, we will conduct surveys  
174 and structured interviews with research staff to evaluate our novel teaching approach and identify  
175 potential pitfalls and further opportunities for improvement.

176 The second main target group are MSc and PhD students at the Institute of Psychology at the  
177 University of Hamburg. In particular, the Master of Science in Psychology is a consecutive program  
178 that is strongly research-oriented. Extensive methodological and statistical skills are taught in required  
179 modules. The degree program places special emphasis on methods, which are taught in depth in  
180 complementary basic research modules, applied modules, a project seminar, and a thesis module.

181 Implementing open and FAIR teaching development will give students the opportunity to participate  
182 in the development of their own teaching materials. While students can view and directly contribute  
183 to the teaching materials as they are developed, they can also participate in the development of  
184 educational resources by contributing feedback on the course contents, for example by reporting ideas  
185 or issues through a dedicated feedback system that is integrated with the course contents. For example,  
186 in a previous course a student reported a problem with an online quiz that was used to assess course  
187 participant's knowledge about the learning materials (see [here](#)). The course instructors could then  
188 respond to the issue directly and link it to the update in the course materials that solve the issue.  
189 This provides transparency to the student who can see when and how the issue was resolved but also  
190 allows future users of the materials to establish provenance and understand why a certain change in the  
191 course materials was implemented. This enables them to reflect on increasingly digital and data-driven  
192 economic and societal processes and thus promotes participatory “self-empowered citizenship”.

As described in the [implementation plan](#), we will pilot the introduction of FAIR and reproducible teaching methods, in courses that focus on teaching digital research skills that will be offered to MSc and PhD students at the Institute of Psychology. We will evaluate the impact of our proposed approach from a student approach that will complement the feedback from the teachers (see above) and help us to further refine the proposed teaching approach.

## Financial Needs

### Overview

	Description	Category	Duration	Costs
1	Student Research Assistant (MSc level) for 30 hours / month	HR	15.08.2024 to 31.08.2025	7573.88
2	Student Teaching Assistant (MSc level) for 2 SWS / month	HR	14.10.24 to 01.02.25	2256.99
3	License for Plausible.io	License	01.09.2024 to 31.08.2025	107.10
4	Travel by train to Berlin for TURN 2024 conference	Travel	14.11.2024 to 15.11.2024	60.00

In sum, the expected **total costs of the project** are ~ **10000 Euro**.

We provide additional justification for the financial needs below.

### Justification

#### Regarding 1 (Student Research Assistant (MSc level) for 30 hours / month):

The student research assistant (RA) will help to create new and adapt existing learning materials focused on the development of FAIR and reproducible teaching materials. Specifically, the student RA will support the development of learning materials for Quarto and Git, the tools that are at the center of our approach. In addition, the student RA will contribute to the development and analysis surveys and quizzes that allow to collect continuous feedback from both students and teachers to address any challenges or identify opportunities for improvement.

#### Regarding 2 (Student Teaching Assistant (MSc level) for 2 SWS / month):

A teaching assistant (TA) is crucial for providing individualized support, timely feedback, and technical troubleshooting to course participants. The TA supports the instructional content, manages assessments during class, and ensures a consistent learning experience for course participants with varying levels of familiarity with the learning concepts.

215 **Regarding 3 (License for Plausible.io):**

216 All course materials will be shared as publicly accessible websites hosted via [GitHub Pages](#). We will  
217 use website analytics to gain insights into reach and dissemination of the teaching materials. These  
218 insights will allow us to better understand how users engage with our online learning materials and  
219 derive opportunities for improvements. We will use [Plausible](#), which provides “intuitive, lightweight  
220 and open source web analytics”, does not use cookies and is fully compliant with GDPR, CCPA and  
221 PECR. A subscription plan with a monthly quota of up to 10k pageviews for 1 year will be selected.

222 **Regarding 4 (Travel by train to Berlin for TURN 2024 conference):**

223 I submitted an abstract to the [TURN 2024 conference](#), taking place in Berlin from 14.11.2024 to  
224 15.11.2024, to give a talk about the proposed teaching approach. The funding will cover travel from  
225 Hamburg to Berlin (and back) by train. Accommodation can be arranged privately.
